Introduction

What is Retail Footprint?

Retail Footprint is the most extensive and expansive retail centre catchment model available.

It is a gravity model that defines catchments for shopping centres selling comparison goods in Great Britain (the UK version also includes Northern Ireland).

These catchments overlap because, as in reality, people within the same area or at different times will shop at a range of different shopping centres.

Retail Footprint calculates comparison expenditure and residential shopper populations for each centre based on the principles that:

- People are more likely to visit larger, more attractive centres.
- People are more likely to visit centres that are easily accessible to them (based on a combination of distance and drive-time).

This comparison goods model looks specifically at catchments for 'comparison shopping' products, such as clothing and footwear, books and DVDs.

Why use Retail Footprint?

Everyday business decisions through to long-term strategies are made using Retail Footprint. Over 250 major clients and retailers within the United Kingdom use Retail Footprint. Below are just some of the ways Retail Footprint has been applied:

- To see the size and extent of shopping centre catchments.
- To calculate the 'real' number of shoppers who visit each shopping centre (as opposed to people who live near a centre but may go elsewhere).
- To estimate available expenditure in each centre.
- To understand the demographics of each centre's catchment.
- As the basis for 'What If' modelling - to understand the impact of changes to centres using CACI's 'Spatial Modeller' software.
- To understand overlaps and cannibalisation between store and centre catchments.
- To assist in location planning decisions for new and existing stores.
- To assess market share and store performance.
- To aid in the optimisation of a retailer's portfolio.

How was Retail Footprint Built?

Gravity Modelling

Retail Footprint is primarily a gravity model. Gravity modelling is based on four general principles, which influence the level of spatial interaction between retail centres:

- Physical distance to (or time taken to reach) the centre.
- The 'attractiveness' of the centre's facilities.
- The degree of intervening opportunities or level of competition.
- The size of the population within an area.

Each of these is detailed in the following sections.

The Retail Footprint gravity model accounts for residentially-based spend, i.e. spend by shoppers travelling from home, and does not include online, tourist or worker spend.

Separate models provide estimates of tourist spend and spend by workers from their place of work. These are added to the gravity model-derived residential spend to produce a total comparison goods expenditure estimate for each centre.

Distance or Time Taken

Perhaps the most important determinant of the level of interaction between residential areas and retail centres is the physical distance that separates them. Shoppers do not like to travel long distances, or more importantly, travel for a long period of time if they can visit a similarly attractive centre more conveniently.

Using drive distance alone proves insufficient in dense urban areas, where, despite a centre seeming to be located close by, the 'cost' in terms of time and effort to get to that centre are under-estimated.

Using drive time alone under-estimates the importance of the 'perceived' cost of getting to a centre in areas where road speeds are high. Models based on drive time alone would not pick up the fact that despite relatively fast roads crossing the Pennines, the large physical and 'perceived' distance between Leeds and Manchester will reduce flows between the two centres.

Therefore, CACI use a combination of both drive distance and drive time within Retail Footprint.

The Retail Footprint model also uses public transport travel times. This is particularly important to retail centres in large urban areas such as London because they have very good access to an extensive public transport system and a large proportion of shoppers at these centres tend to arrive via public transport. This means that the catchments of centres such as Westfield London are more accurate than if only drive times were used.

Attractiveness

Set against the important effect of drive time/distance decay is the 'attractiveness' of a particular retail centre. A larger shopping centre will have much greater 'pulling power' than a smaller suburban centre. As a result people will be willing to travel a greater distance to enjoy the increased benefits of shopping in a larger centre (where there is clearly more choice of outlets and goods, greater presence of key or multiple retailers and perhaps easier car parking facilities).

In Retail Footprint the centre attractiveness is a 'score' based upon:

- The turnover from relevant multiples in each centre.
- The turnover from relevant department stores in each centre.
- The count of independent comparison goods retailers in each centre.
- The count of 'footfall generators' in each centre, e.g. banks, restaurants.

Retail Outlet Scoring

Consumers shop at different outlets, depending on their disposable income and thus retail centre. Retail Footprint is unique in its approach to reflect this.

Average outlet turnover was obtained from published sources. An equation was calculated using the average turnover to derive a proportional score across all scoring fascias e.g. House of Fraser's average outlet turnover is £17.1 million which in the equation equals a score of 47.3. The formula takes into account the benefit of having a large department or anchor store within a retail centre. Where outliers within the market exist, CACI's market knowledge has allowed us to adjust the scores in accordance with real market conditions.

A few examples of retailer scores:

- John Lewis 159.3
- Carphone Warehouse 9.3
- East Clothing 3.9
- WHSmith 7.5
- Wilkinson 18.0

Key local retail services such as banks, optometrists, chemists and travel agents increase the attractiveness and therefore the footfall to a retail centre. To reflect this additional magnetism from these retail services each outlet is awarded a score of 1. Independent comparison goods retailers are also awarded a score of 1, which represents average revenue for this type of outlet.

This approach to scoring is better than a simple count of the retailers within each retail shopping centre, as it reflects the performance and quality of the outlets within the centre and determines the attractiveness of an individual retail destination.

Furthermore each retail fascia has been given a quality allocation; premium, mass or value. This was based on market knowledge, fascia turnover and shopper perception. This allows for analysis based on the quality of the retail provision.

A few examples of retailer quality:

Value	-	Wilkinson, TK Maxx, Argos, Primark
Mass	-	WHSmith, Topshop, Clinton Cards, Boots
Premium	-	House of Fraser, John Lewis, Hugo Boss, Paul Smith

Classification and Interaction

Intervening Opportunities or Competition

The attraction of a particular centre is also connected to the degree of competition (or lack of it) which that centre faces. People will not generally travel to a given centre if the same facilities are available much closer to home. Thus the level of intervening opportunities is important.

Retail Footprint models this complex interaction and is calibrated to reflect real customer shopping patterns using spend data from billions of pounds worth of debit and credit card transactions. In other words, the model was calibrated using real world data.

Retail Centre Classification

Retail Footprint classifies centres into 14 major and 67 minor classes. This reflects retail mix, market positioning, evolving markets and changing competitors in those markets, such as the increasing strength of supermarkets (particularly the Asda and Tesco fascia) in the non-food sector. Each retail centre has been meticulously assessed in order to position it in its correct classification. The classification of a retail centre and the individual score assigned determines how each centre interacts.

A few examples of retail minor classes include:

- Premium Centres
- Medium Conurbation Towns
- Quality London Non-Residential Centres
- Small Non-Conurbation Urban Centres
- Major FOCs Premium Brands
- Shopping Parks
- Retail Parks Minority Fashion
- Large Bulky Goods Retail Parks

See Appendix 1 for the full Retail Centre Classification.

Retail Footprint's classification is the most transparent ever and allows for evolving and new developments in the market place. It is now the most extensive and expansive retail centre catchment model available, covering 4,216 retail centres across Great Britain.

International Transport Termini are not typical of comparison-shopping destinations in terms of having a catchment area that can be modelled, and therefore expenditure figures and catchments are not provided for these. This minor class accounts for 23 centres and are only included as seed points.

Catchments are provided for bulky goods retail parks. These were not included in previous versions of Retail Footprint.

As in previous years, supermarkets are scored in the model by allocating fascia-specific percentages of net selling space to the non-food offer (based on average observed food / non-food sales area splits at various store sizes), then allocating sales per square foot, again based on observed trading patterns, to obtain annual turnover. Supermarket figures are then directly comparable to other comparison goods operators and are scored for Retail Footprint in the same way. Stores of above 50,000 square feet net selling space can potentially become retail centres in their own right when they do not fall within another retail centre.

A small number of Factory Outlet Centres have been scored on the basis of total square footage. These are those FOCs that operate as all-under-one-roof concessions. All other FOCs are scored according to the retailers present as with other centre types.

Retail Footprint 2012 provides an up-to-date assessment of the market. Retail branch data has been updated, and confirmed store closures have been taken into account within the model.

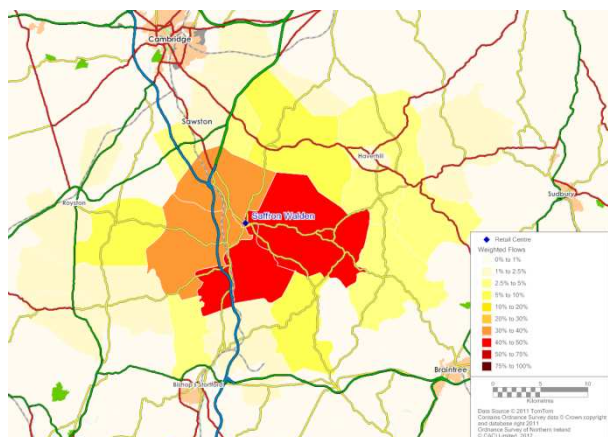

Retail Footprint provides the most current picture of retail centre catchments incorporating the latest new shopping centre openings and developments – by far the most notable of which is Westfield Stratford City.

Residential Shopper Demand

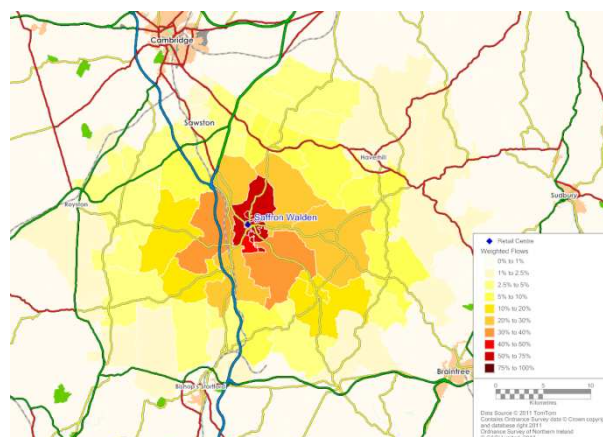

The Building Blocks

People who live in a particular area make up the 'demand' for the products sold in the retail centres. The extent of that demand is primarily a function of population size. The greater the population then the higher the levels of spatial interaction with surrounding retail centres. Residential flows and thus expenditure are applied within the model using these population areas. Worker and tourist spend are applied separately at centre level.

Retail Footprint is built using Lower Super Output Areas (LSOAs) as the geographical building blocks for residential demand. This allows for greater accuracy in calculating market shares and mapping catchments than Postcode Sectors, as there are roughly four times as many Lower Super Output Areas than Postcode Sectors across the country. The results are particularly pronounced for retail centres with small, concentrated retail catchments. The two maps overleaf, showing market share across Saffron Walden's catchment, demonstrate the difference which modelling at LSOA level makes when compared with Postcode Sectors.

Market Share by Postcode Sector

Market Share by LSOA

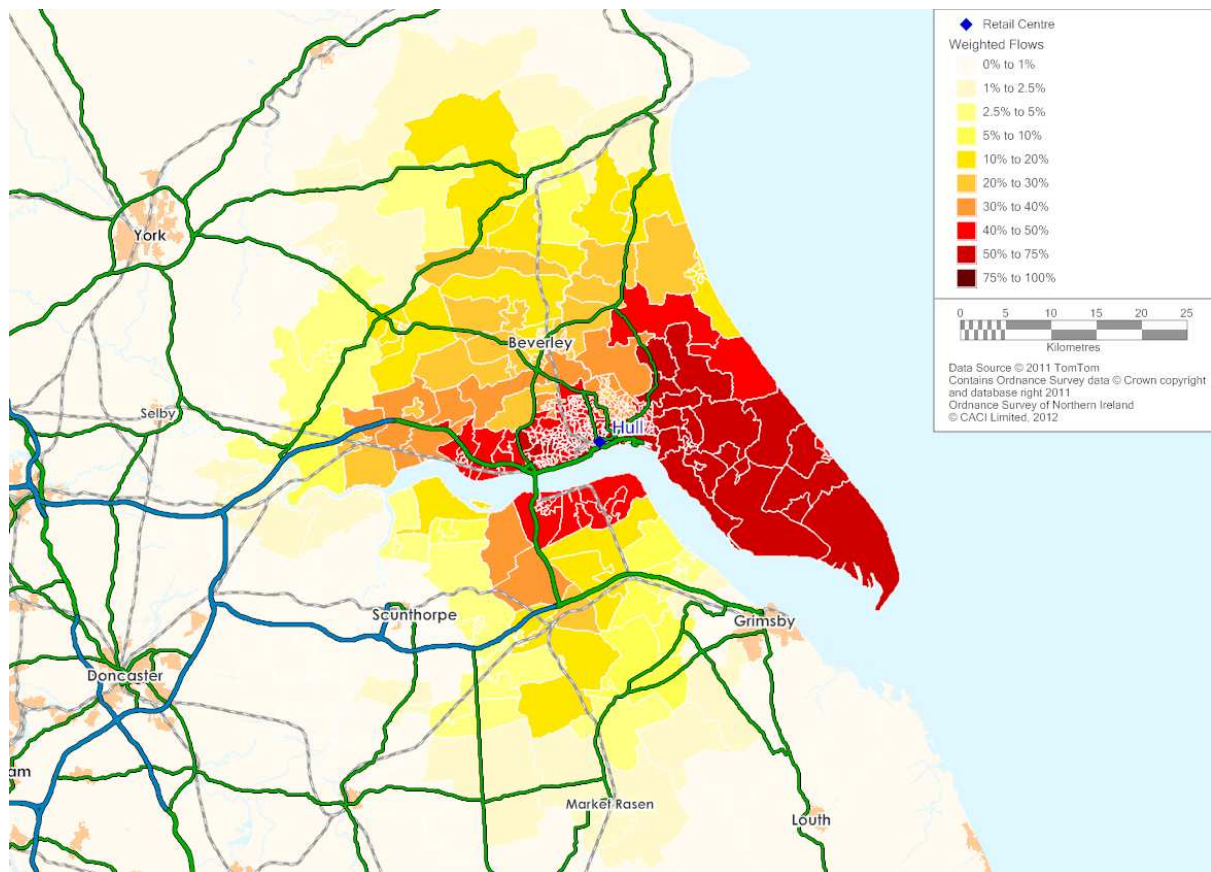

CACI recognises that Postcode Sectors are the preferred analysis level for some clients, and so Retail Footprint is still available at Postcode Sector level. The creation of the Postcode Sector model has been based upon the LSOA model, and so the results of the two versions of the model will be broadly consistent, although inevitable differences will exist.

Market Share: Residential Shopper Population and Comparison Expenditure

Retail Footprint calculates the flow of population from each Lower Super Output Area in Great Britain to each available centre, based on the above factors. By aggregating these 'flows' to each centre we calculate the 'Residential Shopper Population'.

The Residential Shopper Population is the number of people in Great Britain that the model calculates will shop in a particular centre, based on the residential catchment flows. This represents the shopping activity of consumers, equivalent to shopper's total expenditure. It accounts for the fact that, as in reality, catchments overlap, and that the population of a given Lower Super Output Area will visit different centres. Therefore, the Residential Shopper Population will always be smaller than the total 'Resident Population' found within the catchment.

For example, the catchment for Hull (see overleaf) contains a Resident Population of 855,726, whilst the modelled 'Residential Shopper Population' is 217,097. In other words Hull has a market share of approximately 25% of the total residential population in its catchment area.

Market Share by Lower Super Output Area for Hull

The residential comparison expenditure for centres is calculated in much the same way as population. Retail Footprint calculates the share assigned to each centre, based upon the previously mentioned factors and aggregates these weighted expenditures to retail centre level. This is generally what is used for ranking the centres in Retail Footprint. As different areas of the country will spend different amounts on different products due to demographic make-up, it is possible for a centre to rank above another centre in terms of expenditure but not in terms of Residential Shopper Population and vice versa. Tourist and worker expenditure also influence the rankings.

Components of Expenditure

A range of different options are available for defining expenditure or 'Spend' for Retail Footprint centres. Please contact CACI for details.

CACI's default ranking of Retail Footprint centres is based on the LSOA model and is made up of the following constituent parts of 'Comparison Spend':

Residential Spend + Tourist Spend + Worker Spend

Online Spend is not included but can be provided as a 'leakage' figure for each centre, based on the online expenditure within the catchment. Rankings based on different combinations of these four components are available from CACI.

Bespoke rankings are available for a wide range of different spend categories and forecast years.

The following sections describe the methodology for modelling Tourist Spend and Worker Spend. Online Spend is described in detail in the Expenditure Estimates & Projections Technical Guide which is available to licensed users.

Modelling Tourist Expenditure

Estimates of tourist comparison goods expenditure are modelled for Retail Footprint centres from higher level geographical estimates, based on a range of indicator variables.

Tourist spend relates to spend outside the normal routine so covers a wide range of trips including related to overnight stays, daytime excursions and business.

Within Retail Footprint, tourist spend includes that from both domestic overnight and day visitors (i.e. from within the UK) and inbound tourism (i.e. overseas visits).

ONS estimates of tourist spend by sub-regional area are used. In most cases these areas are either Local Authority Districts or Counties. Greater London is split into five areas.

The ONS estimates have been derived using a variety of inputs. Both the supply and demand sides of tourism are considered with the aim of reconciling these at the regional and sub-regional levels for the whole of the UK. The reference year for the ONS estimates is 2008, to be consistent with what was the most recently published UK Tourism Satellite Account - also 2008 and published in May 2011.

In measuring the supply side of tourism, ONS have made use of the Annual Business Inquiry to determine the output of tourism industries, as defined by the Standard Industrial Classification (SIC) of businesses. This includes accommodation, cultural activities, food and beverage serving and so on. This is then balanced against ONS Supply and Use tables at Regional level.

Tourist demand is estimated at the sub-regional level by ONS using a methodology that combines the International Passenger Survey (IPS) for inbound tourism, the annual UK Tourism Survey for domestic overnight visits and, for domestic day visits, information

from the most recent English Leisure Visits Survey alongside the Great Britain equivalent and Northern Ireland TSA to produce estimates of spend by item. These were updated to a consistent base year using multipliers based on annual Household Final Consumption Expenditure (HHFCE) data.

Using the ONS sub-regional tourist expenditure estimates, CACI assign a proportion of the expenditure to represent tourist spend specifically on comparison goods for Retail Footprint. This is based on ONS estimates of spend by high level category within the sub-regional estimates, and reference to the UK Tourism Satellite Account. The proportion varies between areas according to the profile of centres in those areas.

The comparison goods expenditure estimate is split between Retail Footprint centres within each area. We use data on visitor numbers from the International Passenger Survey (IPS) to assign a Tourist Attractiveness to each Retail Footprint centre for this purpose. The IPS includes visitors to named towns/cities as well as visitors only specified at higher levels of geography (e.g. County). A four year average (2007-2010) is taken to minimise any sample size issues for smaller towns. The total sample size across the four years is 194,442.

Some of the IPS data is not town specific. These visits are assigned pro-rata to each Retail Footprint centre within the same sub-regional area. This is notably the case for Greater London. The assignment is restricted to specific minor classes and does not include smaller centres, retail parks or supermarkets.

The assignment to centres is based on a number of combined measures including:

- Minor class of centre (some e.g. retail parks are not allocated tourist spend)
- Retail Footprint Score
- Retail Quality (premium/mass/value)
- Ratio of bulky to non-bulky retail
- For London centres, London Underground passenger volumes
- Other tourist destination indicators

Within the model, some spend to named towns/cities is allowed to leak out to other centres within the same area, so that spend is not too polarised to larger centres. For example, those people recorded in IPS as visiting Oxford will also visit surrounding centres such as Bicester Village.

The total estimated domestic tourist spend is removed from the residential expenditure estimates avoid double counting of spend within Retail Footprint. The amount removed is taken as a percentage of residential spend by LSOA, taking into account the demographic profile of each area.

Some caution should be observed using the tourism figures for smaller centres. Also note that tourist spend in Retail Footprint does not cover non-comparison goods expenditure (for example food and drink, accommodation).

Modelling Worker Expenditure

The estimates of worker expenditure on comparison goods are based on the most up-to-date estimates of workplace population combined with survey information on spend during work-time breaks and taking into account each centre's retail offer.

Expenditure estimates are based upon the 2010 Business Register and Employment Survey (BRES), Census Workplace Statistics and the CACI Workforce Survey. They give estimates of the amount of money spent (current prices) by workers at or near their place of work. Worker expenditure estimates are provided as a total figure for each Retail Footprint centre.

Workplace population estimates for each centre have been brought up to date using BRES data aggregated to Retail Footprint centres. That is, the number of people working within each centre. Centre definitions are specified by boundaries created by CACI.

The average spend per worker in each centre is estimated based on a Workforce Survey, commissioned by CACI, that researched worker spend, for example during lunch breaks, and takes account of different spending behaviours by Social Grade.

Combining average spend per worker and the workplace population estimates provides the potential worker expenditure estimate for each centre. We then take into account the likelihood of workers from beyond the centre itself shopping in that centre, as well as the opportunity to spend in each centre (i.e. the amount of retail provision) to produce the final worker expenditure estimate.

Summary of Key Changes for RF 2012

This year there have been major improvements to Retail Footprint, which now forms part of the Retail Dimensions suite of products:

- We now consider four distinct expenditure elements: residential, tourist, and worker expenditure available to each centre, and also online expenditure which is classed separately as leakage (i.e. the estimate of spend that each centre does *not* receive as a result of purchasing via the internet). Total comparison goods spend for each centre is the sum of the residential, tourist and worker spend. This results in more realistic estimates of spend for those centres where tourism and worker spend are important.

Residential spend (i.e. spend from home) is modelled using the Retail Footprint gravity model, and represented by the Retail Footprint catchment for the centre. Tourist spend and worker spend are modelled separately and assigned at centre level to produce a total spend estimate for each centre.

- Following feedback, we have merged quite a number of retail parks, clustering those that are complementary and in close geographical proximity into single centres, as these generally represent a single destination from the shopper's perspective. The centre name in most cases relates to the largest retail park in the cluster in terms of its Retail Footprint score.
- Catchments are now provided for bulky goods retail parks. So whilst the number of retail park centres has decreased by approximately 100 due to clustering, the number of retail park centres with catchments has increased by over 300.
- Factory Outlet Centres are now scored according to the retailers present, as with other types of centre, rather than modelled using sales floorspace as previously. Only in a small number of cases where FOCs are operated as "all-under-one-roof" concessions is floorspace still used.
- Model classes. The total number of minor classes has increased from 58 to 67, with quite a few changes to the minor class definitions, following extensive updating and calibration of the model. It is important to note that major and minor class IDs in RF 2011 will not match those in RF 2012.

The overall number of major classes is unchanged, but the Fashion Parks and Retail Parks major classes are now combined as Retail Parks, and the Conurbation Towns major class has been split into Conurbation Towns and Metropolitan Towns. Other notable changes to the Retail Footprint classification include:

- o London's West End is assigned to a new International Centres minor class, which reflects its unique position in the retail hierarchy.
- o Retail Park minor class definitions have been changed to better reflect the mix between fashion, non-fashion and bulky goods.
- o Class definitions and model parameters for London centres have received particular attention, for example to ensure that smaller centres pull a realistic level of spend where previously larger centres tended to over-dominate.

- For licencees of the UK version of Retail Footprint, almost all centres in Northern Ireland have now been aligned with the centre classification for Great Britain, with only one additional class (Ireland - Small Purpose Built District Centres).
- More extensive data has been used for calibration than ever before. We now hold credit and debit card transaction data relating over £18bn of sales at retail centres. A substantial amount of effort goes into the calibration of Retail Footprint each year to ensure it reflects the most up-to-date real world data available.
- New schemes added. New shopping centre schemes and other developments are constantly monitored by CACI, and those open at the time of release of Retail Footprint have been incorporated.
- The underlying drive time and public transport networks have been updated and recalibrated, so take into account recent developments to road and other modes of transit.

Notable changes to the centre rankings for 2012 include:

- London-West End is still ranked number one, although there is now an even larger gulf between the West End and the second largest centre, primarily due to the increased significance given to workers and in particular to tourist spend.
- Glasgow remains in the number two spot, but Manchester has overtaken Birmingham to third place. Manchester's stronger worker and tourism spend make up the change.
- Knightsbridge has shot up the rankings to number 8, inevitably driven by the vast tourist pull. Other big climbers also relate to tourism: Covent Garden, King's Road, Bath and Bicester Village.
- Fallers near the top of the rankings are the cities which lack the tourist pull and that have sizable out of town competition including from those newly added bulky goods retail parks. Sheffield, Reading and Merry Hill are examples of these.
- The newly opened Westfield Stratford City enters at 11th place overall. This excludes the one-off impact of the Olympics.

Many traditional town and city centres are now living in the shadow of Out of Town shopping. For example, Swindon and Durham now see more 'comparison' or 'traditional High Street style' shopping going to the combined Retail Parks and large supermarkets surrounding the town/city than to the traditional town/city centre.

Similarly the combined Retail Parks and large supermarkets in Stockton and Middlesbrough now contain more comparison spending than Middlesbrough town centre. Some even larger towns and city centres are teetering on the tipping point. Swansea, Bournemouth and Bradford now see almost identical levels of spending in their town/city centres and the combined Out of Town offers. If it were not for the level of tourist and worker spend attracted to the historic city centre of York then the combined Out of Town retail parks plus the McArthurGlen Factory Outlet would take more than the city centre.

Advice for Model Users

The Four Catchments Explained

Lower Super Output Areas to Centre Weights

Every Lower Super Output Area (LSOA) that sends flows of people (spend) to a centre will have a weight attached. This is the proportion of that LSOA that goes to the centre. For example, the table below shows an LSOA in Fulham, London, and the retail flows of more than 5% rounded to the nearest percentage point.

LSOA	% Flows Go To:	Retail Centre	Minor Class
E01001916	19	London – Putney	Larger London Urban Centres
	13	London – West End	International Centres
	12	Westfield London	Large London Regional Malls
	6	London - King's Road	Larger London Non-Residential Centres
	5	London - Fulham Broadway	Larger London Urban Centres
	5	London - Wandsworth	Larger London Urban Centres
	5	London - Kensington	Premium London Centres

Fig 1 – Example of Retail Centre Flows above 5% for LSOA E01001916.

Calculating the Four Catchments

- The model calculates the total flow of residential comparison goods expenditure to each centre based on *the LSOA to centre weight* E.g. for London – Fulham Broadway this is an expenditure figure of £48.897 million per annum.
- All flows from LSOAs going to a centre are then ordered, with the biggest weight at the top.
- For every LSOA going to a particular centre the model then calculates *the share of the centre's total spend* - in the case of E01001916 this is $(£0.180m / £48.897m) * 100 = 0.37\%$.
- These proportions are accumulated *until at least 50%* of flows have been assigned - this defines the primary catchment.
- The remaining LSOAs are then accumulated to define the 3 remaining catchments at 75%, 90% and 100% respectively.

Use all Four Catchments?

Centres have up to four catchments – these are defined as follows:

1. Primary - At least 50% of flows to a centre
2. Secondary - At least 75% of flows to a centre
3. Tertiary - At least 90% of flows to a centre
4. Quaternary - Remaining flows to a centre

- When *analysing* data (population figures, expenditure estimates etc.) you should use all 4 catchments – as this represents the whole catchment for the centre.
- For *mapping* purposes you may wish to just show catchments 1, 2 & 3 as it can look tidier and the flows from the quaternary catchment are often very small.

Only if you have carried out analysis of observed flows, and know that your catchments are smaller, would we recommend excluding any of the catchments from analysis.

“One of my catchments is missing”

- Based on the above methodology ‘Calculating the Four Catchments’ it is possible for some small centres not to have all four catchments. For example, if a single Lower Super Output Area takes you from 55% to 100% you would get a secondary catchment, as this sector gives you *at least 75%* of flows. This centre would not have a tertiary or quaternary catchment.

In short – the primary catchment is where at least 50% of a centre’s flows come from – based on the Lower Super Output Areas that give *the greatest share of their shoppers* to that centre.

It *does not* mean that at least 50% of a LSOA’s shoppers go to that centre.

Making Changes to Retail Footprint

When using the SpatialModeller/Impact application (see separate guide) you may wish to alter the provision being offered in the centre, which determines the retail centre score.

SpatialModeller users can use scores for individual retail fascias in order to change a centre’s attractiveness, by either adding or taking away the score for the retailer under consideration from the centre depending on the situation. Then, if required, the classification of the centre could be changed to reflect its new attributes following the centre classification rules.

If a retailer is relocating, it is important to remember this when adding additional scores to a centre, in order to remove the old contributing retailer’s score. For example a number of retailers in Wakefield relocated to Trinity Walk from outlets in the Ridings Centre and other parts of Wakefield when this opened last year, and the same phenomenon has been seen previously in Birmingham (Bull Ring), Liverpool (Liverpool One) and Leicester (Highcross).

The model can then be run to determine the impact and change to the national retail environment.

SpatialModeller/Impact users receive a separate user guide for Impact and also all fascia scores and Retail Footprint centre classification rules.

Appendix 1 - The Retail Footprint Classification

The following summarises the characteristics and rules classifying retail centres into their 14 major and 67 minor classes. All figures relate to GB centres only, not including Northern Ireland.

1. PRIMARY CENTRES

Centre Count: 43

Avg Score: 1,818

Avg. Expenditure: £767m

These are the largest of the UK's traditional shopping High Streets in terms of both the number of comparison retailers and the number of shoppers visiting the centre. They are all located in the heart of a major city and are dominant in their respective regional shopping hierarchies. Their average Retail Footprint centre attractiveness score is 1,818 with an average 12.1% market share of residential-based expenditure within the catchment. There are 43 retail centres in the Primary Centres classification and average comparison goods expenditure is £767 million per annum.

1. International Centres

This class is occupied solely by London - West End which exhibits characteristics that set it apart from any other Primary Centre, both in terms of its size and as a centre with an international reputation. It has an RF Score of 6,758 which is almost twice that of the next largest centre, and is Number 1 in the rankings for residential, tourist and worker spend.

2. National Centres

After London's West End, these are the most significant retail centres in the country and demonstrate an immense influence at both local and national level. Retail Footprint scores are in excess of 2,500. This indicates the strength and breadth of the retail offer covering all qualities of retailer. These centres pull from geographic areas well in excess of their regional location. Only five centres fall within this top tier and they are Glasgow, Manchester, Birmingham, Liverpool and Nottingham.

3. Principal Centres

This is a nationally represented centre usually described as a major city. They demonstrate high regional influence but can also extend beyond this range and most have a Retail Footprint attractiveness score greater than 1,650 and more than 30% premium retailing. This demonstrates the strength and diversity of the retail offer across all qualities of retailer. Examples of retail centres currently falling within this retail class are Leeds, Cardiff and Bristol.

4. Quality Regional Centres

These are centres with a mainly regional influence, but also including some larger cities. Retail Footprint scores are in excess of 1,200. These centres tend to have less of a shopper pull than Principal Centres due to the smaller number of retailers, and tend to be located a reasonable drive time away from Principal Centres. Quality Regional Centres have in excess of 15% premium retailing, and examples include Bath, Southampton and Guildford.

5. Average Regional Centres

These centres have a score in excess of 1,000 and a town population in excess of 100,000, but have less than 15% premium retail provision. These centres are less attractive than Quality Regional Centres, and are not able to pull shoppers from such great distances. Examples of Average Regional Centres include Hull, Plymouth and Ipswich.

2. MAJOR CENTRES

Centre Count: 100

Avg Score: 807

Avg. Expenditure: £212m

These are large 'traditional' High Street centres located in the middle of either large towns or 'secondary' regional cities. These are the second tier in the regional shopping hierarchy in terms of both the number of comparison outlets and shopper numbers. Major Centres have an average Retail Footprint attractiveness score of 807 and market share of 8.5%. 100 retail centres are classified as Major Centres and average comparison goods expenditure is £212 million.

6. Premium Centres

Centres within this class demonstrate a high proportion of premium quality retail provision (greater than 20%) and a significant number of retailers. Retail Footprint attractiveness scores are in excess of 850. The combined size and quality of the offer ensures that shoppers can be drawn from a wide area. Premium retail centres include Tunbridge Wells, Harrogate and Canterbury.

7. Quality Centres

These centres demonstrate a relatively high proportion of premium quality retail provision (mostly greater than 10%) but typically have a smaller number of retailers than Premium Centres. Retail centres within this class have an attractiveness score greater than 800. Quality retail centres include Maidstone, Salisbury and High Wycombe.

8. Average Centres

Retail centres in this class are typically mass-market in profile, and displaying some elements of premium, mass and value retail offer types. These centres display neither a premium nor value retail provision bias,

though there is usually more of the latter present. Average retail centres include such locations as Doncaster, Stirling and Stoke-on-Trent - Hanley.

9. Lower Average Centres

Centres within this class have a majority of mass retailing, but also greater than 30% value retailing and hence possess a slight bias towards the lower end of the market. Examples of these retail centres include Southend-on-Sea, Poole and Burnley.

10. Value Centres

Centres within this class display a high proportion of value retailers (greater than 40%) and little premium provision (less than 5%). They demonstrate the lowest attractiveness of any major centre class, and a substantial change in retail mix would be needed to change the perception of a town in this class. Centres within this classification include Great Yarmouth, Barnsley and Corby.

11. Town Centre Malls

Milton Keynes is unique, being the only retail centre falling into this class. Due to the nature of the town's development, the facilities and access at the centre, its behaviour is unlike any other retail centre, in that it is the only in-town shopping venue that behaves like an out-of-town regional shopping mall. It is easily accessible from areas located outside of Milton Keynes and excellent parking facilities exist. It sits in the middle of the country's most successful New Town, whose residential population is expected to continue increasing rapidly. It is also home to many company headquarters and has a large workforce centrally located.

12. Mall-Dominated Town Centres

This class represents in-town retail centres, with a large proportion of their retail provision falling within shopping centres. There are 11 centres within this class, and as these are generally New Towns they offer easy car access to their town centres, with considerable car parking provision attracting shoppers from considerable distances. Examples of these centres include Crawley, Telford, Redditch and East Kilbride.

3. CONURBATION TOWNS

Centre Count: 58

Avg Score: 612

Avg. Expenditure: £156m

Conurbation Towns fall within large city conurbations and are strong centres in their own right, but are located close to stronger retail centres (city centres), which have a significant influence on their catchments. The average Retail Footprint score for Conurbation Towns is 612 and average residentially based market share within the catchment of 6.0%. There are 58 retail centres within the Conurbation Towns classification and average comparison expenditure is £156 million. Due to their number and different characteristics, centres in London are classed separately from other Conurbation Towns.

13. Medium Conurbation Towns

These centres are situated in conurbation areas, and most have an attractiveness score above 500. Centres are generally mass-market led, most containing less than 10% premium retailing. Examples of centres in this class include Stockport, Ashton-under-Lyne and Paisley.

14. Small Conurbation Towns

These centres are located within conurbations and have an attractiveness score between 200 and 500. There is a bias towards the value end of the market, and little if any premium retailing. Examples of Small Conurbation Towns include Bootle, North Shields and Dudley.

15. Premium London Conurbation Towns

This class represents the three centres that are much larger in terms of provision than any other retail centres in this major class – Croydon, Kingston upon Thames and Bromley. These centres have more than 10% premium retailing, an attractiveness score in excess of 1,300 and have a strong focus on fashion with around 50% of the attractiveness score coming from clothing and footwear retailers.

16. Quality London Conurbation Towns

These London centres have greater than 10% premium retailing but are smaller than Premium London Conurbation Towns, with an attractiveness score less than 1,300. Example centres include Richmond – Surrey, Ealing Broadway and Wimbledon.

17. London Conurbation Towns

These centres fall within the London conurbation area and most have less than 10% premium retailing. The class also includes a small number of centres that have a higher premium percentage, but are kept in this class due to their limited size. The retailing strength of these centres ranges between 450 and 1,200 in terms of centre attractiveness. Examples include Romford, Bexleyheath and Hounslow.

4. METROPOLITAN TOWNS

Centre Count: 87

Avg Score: 321

Avg. Expenditure: £61m

Metropolitan Towns are similar to Conurbation Towns but are located in the vicinity of, rather than within conurbation areas. The average Retail Footprint score for Metropolitan Towns is 321 with a catchment residential market share of 4.8%. There are 87 retail centres within the Metropolitan Towns classification and average comparison expenditure is £61 million.

18. Quality Metropolitan Towns

This class incorporates upmarket centres outside of the largest conurbations in the country with more than 10% premium retailing. This class is separate to its major conurbation counterpart in order to ensure that the different dynamics in the marketplace between conurbation and other metropolitan areas are successfully represented in Retail Footprint. Centres such as Beverley, Marlow and Wilmslow are included in this class.

19. Value Metropolitan Towns

These centres are situated outside major conurbations and demonstrate a bias towards value retailing and little if any premium retailing. Value Metropolitan Towns include Redcar, Hinckley and Havant.

5. REGIONAL TOWNS

Centre Count: 117

Avg Score: 387

Avg. Expenditure: £66m

Regional Towns, often called market towns, have a similar retail offering to Metropolitan Towns. Generally found more than 20 minutes drive time away from other primary or major centres, they tend to be dominant within their vicinity. As such they are the main destination for a large share of the shoppers in the immediate areas around the centre, with an average residential shopper population of 28,502. The Retail Footprint average attractiveness score for this class is 387 with a residential market share of 6.9% - this figure is, however, not really comparable with Primary and Major Centres as the market size is much smaller. There are 117 centres within the Regional Towns class and average comparison expenditure is £66 million.

20. Quality Regional Towns

These upmarket destinations have an attractiveness score greater than 300 and a retail mix with notably less value provision than other Regional Towns. Some centres benefit from tourism, which may in turn have enticed premium retailers to locate within them. The greater premium and mass offer leads to a value provision generally less than 35% and premium provision greater 10%. Quality Regional Towns include Winchester, Stratford-upon-Avon, and Cirencester.

21. Medium Regional Towns

Centres within this class have an attractiveness score greater than 300 and are oriented towards a middle of the road retail offer with less than 10% premium retailing. A number of these centres do not reflect the affluence in surrounding residential areas with their retail offer, having fallen behind bigger and better centres nearby. Examples of Medium Regional Towns include Yeovil, Newark-on-Trent and Dunfermline.

22. Small Regional Towns

These are the smallest regional town destinations, with an attractiveness score less than 300. Many of these centres are dominated by value retailing as they lack the necessary size and shopper profile to attract more upmarket retailers. However some centres benefit from tourism and have more of a premium offer. Examples of Small Regional Towns include St Andrews, Berwick-upon-Tweed and Petersfield.

6. URBAN CENTRES

Centre Count: 1,291

Avg Score: 71

Avg. Expenditure: £13m

Urban Centres by definition are located in large urban areas. The size and location of centre varies considerably, from London – Knightsbridge (score of 1,511) to small centres such as Newcastle upon Tyne - Kenton (score of 1). There are 13 Urban Centres minor classes, reflecting this degree of variation. The average Retail Footprint score is 71 and average share of the residential population visiting these centres is low, at 1.4%, due to the close proximity of more dominant centres. Average comparison expenditure is £13 million, though some centres have much higher spend: exceptions include London – Knightsbridge (£1,146m), London – Covent Garden (£1,013m) and London – King's Road (£703m), all of which benefit from very high levels of tourist trade.

23. Medium Conurbation Urban Centres

This class consists of centres in conurbation areas that do not have the necessary retail pull to be considered as Conurbation Towns. Retail Footprint scores are greater than 100 but typically less than 200. Examples of this centre class include Wythenshawe, Edinburgh - Leith and Leeds - Headingley

24. Small Conurbation Urban Centres

These are the smallest centres situated in major conurbations, with a Retail Footprint score generally below 100. Examples include Birmingham - Handsworth, Bristol - Westbury-on-Trym and Manchester - New Bury Road.

25. Medium Non-Conurbation Urban Centres

These centres are found in a variety of urban settings, except for the major city conurbations, and have enough of a presence to draw trade but

are not particularly significant retail centres. Retail Footprint scores are greater than 100 and typically less than 200. Examples include Westcliff-on-Sea, Cosham and York - Acomb.

26. Small Non-Conurbation Urban Centres

This class covers the smallest urban centres that are not in conurbation areas, and have a Retail Footprint score of less than 100. There are many examples of such centres including Shoeburyness, Reading - Lower Earley, and Cardiff - Cathays.

27. Larger London Non-Residential Centres

These are the largest and most upmarket non-residential centres within London, which draw shoppers from large distances with their large and varied retail supply. Their physical locations mean they rely much more upon worker and tourist flows than the residential population living around them. More than 50% of the retail provision at these centres is premium, the centres' retail scores are in excess of 1,000 and act as principal destinations for a large share of the shoppers in the immediate area of the catchment. There are just three centres that fall within this class: London - Knightsbridge, London - Covent Garden and London - King's Road.

28. Premium London Non-Residential Centres

More than 50% of the retail provision in these centres is premium, with value retailing accounting for less than 5%. These are significant London centres that draw a high volume of trade, much of which is through workers and tourists. However the very largest centres are not included in this class and Retail Footprint scores are less than 1,000. There are six centres in this class including London - Canary Wharf, City of London - Cheapside and London - Marylebone.

29. Quality London Non-Residential Centres

These centres have less of an upmarket bias than Premium London Non-Residential Centres and include some element of value retailing, but still contain at least 30% premium retailing and scores in excess of 150, and so draw shoppers from across large catchment areas. Examples of centres in this class include City of London - Fenchurch Street, City of London - Broadgate and London - Spitalfields.

30. Average London Non-Residential Centres

In their immediate locality these are the primary destinations for shopping. Each of these centres is located in or around central London, with major central London centres such as the West End, Covent Garden and Knightsbridge affecting their catchments. These centres have a decent concentration of workers. Premium retail provision makes up less than 30% of the offer. Examples of this retail class include London - Victoria, London - Paddington and London - Bloomsbury.

31. Premium London Centres

These London Centres are located in the large upmarket urban areas of London and are unique in their offer and behaviour. These centres benefit from a substantial proportion of premium retail provision and low levels of value provision (in most cases greater than 30% premium and less than 12.5% value). The Retail Footprint attractiveness score must also be at least 300. Centres in this class can attract shoppers from some distance away, particularly affluent ones – this effect varies in strength according to centre size. Premium London Centres include London – Kensington, London - Hampstead and London - Portobello Road.

32. Larger London Urban Centres

This class represents sizeable residential retail centres within the London area, with predominantly mass retailing. Centres within this class have a score in excess of 260, have a mass-orientated offer (representing at least 50% of provision) and sufficient value retailing (at least 12.5%) for these centres not to be considered as premium shopping destinations. Examples of these centres include London – Hammersmith, London – Camden Town and London – Clapham Junction.

33. Average Inner London Urban Centres

These Urban Centres are located within Inner London and typically perform a very localised function, with a retail attractiveness score less than 260. The value provision for these centres is less than 40% of the retail on offer, though within this context centre profiles can vary. This class includes centres such as London – Muswell Hill, London - West Hampstead and London - Lavender Hill.

34. Value Inner London Urban Centres

These centres within Inner London are characterised by a retail profile strongly biased toward the lower end of the market, with over 40% value retailing. Examples of centres within this class include London - Wood Green, London - Peckham and London - Elephant & Castle.

35. Outer London Urban Centres

Centres within this class are situated in Outer London or within the M25 and have a Retail Footprint score of less than 500. As such these centres provide local comparison goods shopping across the full demographic spectrum of suburban London, with examples including Wembley, Ruislip and East Sheen.

7. LOCAL CENTRES

Centre Count: 923

Avg Score: 44

Avg. Expenditure: £4m

Local Centres are located within easy striking distance of major towns and cities, but lie outside those settlements' boundaries – illustrating their difference from Urban Centres. They tend to have fewer comparison outlets and are lower in the local shopping hierarchy. The average Retail Footprint attractiveness score is 44 and the average market share of residentially-based spend is 1.4%. The average residential shopper population across this major class is very low (1,543). There are 923 centres within the Local Centres classification and average comparison expenditure is £4 million.

36. Better Local Centres

These centres have a bias towards a mass retail offer, with generally at least some premium provision and less than 30% value retailing. Their Retail Footprint score is greater than or equal to 50 and less than 200, reflecting the slightly larger offer of a Better Local Centre within its major class. Examples include Bakewell, Wetherby and Thame.

37. Average Local Centres

These centres are primarily mass and value oriented, with the vast majority having greater than 30% value provision, and most have no premium retailing. Owing to their size (each centre must have a score of at least 50 and less than 200) and retail mix, centres of this type would be expected to draw most of their trade from the local area. Average Local Centres include Consett, Alloa and Stowmarket.

38. Small Local Centres

The majority of these centres are very small (Retail Footprint score of below 50), and with a limited retail offer and too little retail provision to show a bias in their market position. Despite their small impact on the retail landscape this is actually the largest of all the minor classes in terms of the number of centres. Examples of Small Local Centres include Market Deeping, Hayling Island and Kidlington.

8. RURAL CENTRES

Centre Count: 539

Avg Score: 39

Avg. Expenditure: £7m

Rural Centres are located in similar areas to Regional Towns. However, they have a lower level of retail provision and corresponding smaller catchments. These isolated centres tend to serve the local community effectively but do not have the mix of outlets to encourage shoppers from further distances. Conversely, these centres tend to have fairly high levels of loyalty from locals due to the 'cost' of travelling to an alternative centre. Some of these centres are highly isolated and have a small but loyal and relatively static retail catchment.

Rural Centres tend to be large enough to support the basic needs of just the very local catchment. Similar sized centres in less remote areas would see much higher levels of competition from nearby more attractive centres and would compete poorly. The average Retail Footprint attractiveness score is 39 with an average residential shopper population of 2,814. There are 539 centres falling into this classification and average comparison expenditure is £7 million.

39. Large Rural Centres

Centres within this class are the largest of rural centres, but are not large enough to be Regional Towns in their own right. Some of these centres benefit as significant rural tourist destinations. They have Retail Footprint scores of between 100 and 200, and examples of centres within this classification include Haverhill, Ebbw Vale and Fort William.

40. Medium Rural Centres

These average-sized Rural Centres have Retail Footprint scores of between 25 and 100, and so occupy a relatively minor position in the retail hierarchy by serving local rural communities, and in some cases a notable tourist trade. Example centres are Prestatyn, Axminster and Stow-on-the-Wold.

41. Small Rural Centres

Centres within this minor classification would play second fiddle to any other rural centres nearby, as Small Rural Centres are those centres with a score of less than 25. Examples of centres within this classification include Perranporth, Kirkcudbright and Bourton-on-the-Water.

9. REGIONAL MALLS

Centre Count: 13

Avg Score: 1,145

Avg. Expenditure: £688m

Regional Malls, such as the Trafford Centre and Bluewater are located in 'non-traditional' retail locations, usually on the edge of large urban areas. They tend to offer a strong core range of comparison outlets within a confined and clearly defined centre.

These centres often have a catchment that covers a very large physical area, with shoppers drawn from a considerable distance due to the attraction of a single centre that meets their retail needs in full. Additional leisure facilities, plentiful parking and the modern conveniences that these centres offer, along with in many cases dedicated feeder roads just off main arterial routes, further attract shoppers.

The average Retail Footprint attractiveness score is 1,145 with a residential shopper population of 327,387. Catchment market shares are low (average 6.8% of residential spend) with Regional Malls tending to be used for large-scale leisure and event-driven shopping trips by people throughout the region. The majority of shoppers use more traditional centres for their regular comparison-shopping trips. In recognition of the unusual scope of such centres, there are only 13 Regional Malls nationally with average comparison expenditure of £688 million.

42. Large Regional Malls

These centres are the epitome of large-scale mall retailing, with shopper populations and catchments that rival and compete with some of the largest Primary Centres. Centres of this type comprise at least 40% mass retail, with premium retailing making up the majority of the remaining offer for most centres. There are five centres within this class, of which Cribbs Causeway, Meadowhall and Trafford Centre are examples.

43. Small Quality Regional Malls

With a Retail Footprint score less than 800 these are still significant centres in their own right, and premium retailing accounts for at least 15% of the total centre score. There are currently only two centres in this class: Glasgow - Braehead Shopping Centre and Silverburn.

44. Small Regional Malls

Centres in this class must have a Retail Footprint score of less than 800 and less than 15% premium retailing. Leeds – White Rose is currently the only Regional Mall to fit this description.

45. Large London Regional Malls

This class accommodates Westfield London alone. Customers are drawn from a wide area given the retail offer of the centre, which has a score in excess of 1,700. The centre has a very strong premium offer and as such also succeeds in drawing in a large volume of tourist retail trade over and above that drawn from its residential-based catchment.

46. London Regional Malls

Whilst not as large in terms of the retail attractiveness score as Westfield London, there are two other Regional Malls that are situated within the London urban area. These are Brent Cross and the newly opened Westfield Stratford City. Although belonging to very different eras in terms of their origin, they both have a high proportion of premium retail (over 50%), very little value retailing, and attract trade from a large swathe of London.

47. Premium Outer London Regional Malls

The emphasis for any centre of this type is quality; premium provision must be equal to or greater than 45%. Bluewater is the only Regional Mall that currently displays these premium attributes beyond the London inner urban area, and with a Retail Footprint score over 1,600 is a major out of town shopping destination.

48. Outer London Regional Malls

This class is occupied solely by Thurrock Lakeside as a Regional Mall in the London/M25 area which, whilst a significant shopping destination with a Retail Footprint score of over 1,100 does not have sufficient premium retail for it to be considered directly against its competitor in Bluewater.

10. PURPOSE BUILT DISTRICT CENTRES

Centre Count: 13

Avg Score: 304

Avg. Expenditure: £89m

Purpose Built District Centres are essentially smaller regional malls serving a more localised area. They are located in areas serving several towns or districts. The retail offer is more limited than a regional mall, but they nearly always include a large supermarket, whose non-food offer (if applicable) is also incorporated into the attractiveness score.

The average Retail Footprint score is 304 highlighting the smaller retail offer in comparison to Regional Malls. Residential market share for the catchment is on average 5.7%. There are 13 centres within this classification with average comparison expenditure of £89 million.

49. Average Purpose Built District Centres

These centres are firmly in mass market territory, with many major mass retailers catering to a localised market, and less than 35% of retailing in the value sector. Retail Footprint scores are over 150. Examples of Average Purpose Built Centres include Edinburgh - Gyle Centre, Edinburgh - Ocean Terminal and Peterborough - Serpentine Green.

50. Value Purpose Built District Centres

These centres have a higher proportion of value retailers than Average Purpose Built District Centres, with value provision making up at least

35% of the retail mix. Centre attractiveness scores exceed 150 but these centres are recognised as inferior to the main town centre offer in their location and may also be secondary to other non-town centre locations. Examples of Value Purpose Built District Centres are Birmingham - One Stop Shopping Centre, Sheffield - Crystal Peaks and Cambridge - Grafton Centre.

11. FACTORY OUTLET CENTRES

Centre Count: 49

Avg Score: 213

Avg. Expenditure: £82m

Factory Outlet Centres (FOCs) offer a distinct retail mix, focused around providing branded goods at discounted prices. Because the full range of comparison goods is not available, shoppers tend to only visit such centres for a minority of their shopping trips. As a result the average market share in the residential catchment is just 4.5%. There are 49 Factory Outlet Centres with an average comparison expenditure of £82 million.

Catchments tend to cover a large geographical area with bargain hunters willing to travel considerable distances for this unique retail offer. Some FOCs also attract a significant tourist trade. A number of the (mostly smaller) FOCs do not have distinct retail units and their score is based upon the total size of retail floorspace at the centre, as opposed to the national average outlet turnover used for regular high street stores.

51. Major FOCs Premium Dominated

Centres of this type are dominated by premium retail – 50% or more of the outlets in the centre belong to this offer type. Centres also have attractiveness scores of at least 550, so include some of the largest FOCs in the country. With their premium focus, these centres have the potential to attract a high tourist throughput. Bicester Village, Cheshire Oaks - McArthurGlen Outlet Centre, York - McArthurGlen Outlet Centre are the three centres that fall within this class.

52. Major FOCs Premium Brands

Centres such as these have a significant premium offer, representing at least 18% of retailers, and have an attractiveness score of at least 300 but less than 550. These centres are therefore smaller and have less of a premium bias than the Major FOCs Premium Dominated class, but are of sufficient size to take advantage of the good retail mix. Examples include Street - Clarks Village Outlet Centre, Castleford - Junction 32 Outlet Village and Livingston Designer Outlet.

53. Major Urban FOCs Premium Brands

Portsmouth - Gunwharf Quays is the only centre in this class, as it is the only Factory Outlet Centre located within a city centre. The proportion of premium retail is much higher than that of value retail. Due to its location close to a city centre the catchment shows characteristics of more

traditional retail centres, and it also attracts a significant tourist expenditure.

54. Major FOCs Mass Market

Centres in this class are much more mass-market oriented, with less of an emphasis on premium retail than those in the other Major FOC classes. Indeed, in each centre by far the largest retail type is mass, with value and premium retailing often in similar proportions to each other, or with some bias towards value. Examples include Hatfield - The Galleria, Gloucester Quays Outlet Centre and Salford - Lowry Outlet Mall.

55. Medium Sized FOCs

These FOCs are smaller than Major FOCs, with a Retail Footprint score between 100 and 200, and in many cases are smaller than the town centre offers closest to them. Ebbw Vale - Festival Park Outlet Centre is a prime example of this type of centre, as are Bideford - Atlantic Village and Brighton Marina Outlet Centre.

56. Small Sized FOCs

These are the smallest FOCs and quite a number of these take the form of 'under-one-roof' concessions. Retail Footprint scores are less than 100. Colne - Boundary Mills, St Asaph - The Tweedmill and Wilton Shopping Village are examples of centres in this classification.

12. RETAIL PARKS

Centre Count: 881

Avg Score: 110

Avg. Expenditure: £28m

Centres in this major class include Shopping Parks, Retail Parks and Bulky Goods Retail Parks. There are 881 centres in this class, with an average expenditure of £28m and Retail Footprint score of 110.

Shopping Parks such as Leicester - Fosse Park, which provide a fashion-based out of town offer, give residents an additional shopping destination for High Street non-discount comparison goods. As opposed to Regional Malls, these are uncovered and tend to be large sheds occupied by individual High Street retailers. Due to the out of town location, parking and food services are usually provided. Supermarkets are also often present, sometimes including a non-food element that has been incorporated into the attractiveness score where applicable.

Centres classed as Retail Parks tend to be located in edge of town locations. They offer a very different retail mix from traditional High Streets, with more outlets serving the household goods market (furniture, large electrical) than the comparison goods market. Over recent years though, Retail Parks with comparison High Street outlets have emerged in the retail environment along with the supermarket non-grocery offer.

Bulky Goods Retail Parks are defined in Retail Footprint as having at least 60% of the comparison goods offer (the attractiveness score) dedicated to bulky goods.

57. Major Shopping Parks

These are very large retail parks, either in their own right or in combination with neighbouring retail parks, with the emphasis on fashion and also on scale. Centres in this class have a fashion offer comprising at least 35% of the total retail offer, and in many cases closer to 50%, and an attractiveness score of over 250. Edinburgh - Fort Kinnaird Retail Park, Leicester - Fosse Park and Bournemouth - Castlepoint are examples of Major Shopping Parks.

58. Shopping Parks

Centres within this class are comprised of individual retail parks or clusters of parks that have scores in excess of 150 and at least 35% of the centre's retail offer made up of fashion retailing. This class also includes retail parks that contain less fashion than this but are of significant size (with scores of at least 200), due to their size meaning they have a strong retail gravity in their own right. Examples of this class include Haverfordwest - Withybush Retail Park, Watford - Waterfields Way and Cheshunt - Brookfield Retail Park.

59. Large Retail Parks

These are retail parks with an attractiveness score of over 100 and can offer a wide range of retailers by type. They are likely to include some fashion and/or bulky goods retail elements, with Aberdeen - Berryden Road, Coventry - Gallagher Retail Park and Bournemouth - Ringwood Road Retail Park being examples of this type of centre.

60. Retail Parks Majority Fashion

These retail parks have an attractiveness of less than 100, and contain at least 35% fashion retailing and less than 60% bulky goods. Examples of these centre types include Liverpool - Wavertree Retail Park, Reading - Reading Link Retail Park and Dumfries - Peel Centre Retail Park.

61. Retail Parks Minority Fashion

The retail parks in this class have an attractiveness score less than 100 and contain some fashion retailing, although it comprises less than 35% of the offer. Bulky goods comprise less than 60% of the retail offer. Bangor - St David's Retail Park, Lincoln - St Marks Retail Park and Aylesbury - Vale Retail Park are examples of this type of centre.

62. Large Bulky Goods Retail Parks

These are the largest of the parks in which bulky goods (i.e. household goods such as furniture and large electrical products) dominate. Centres in this class have an attractiveness score of at least 100 and at least 60% of the comparison goods retail offer is bulky goods. St Helens - Ravenhead Retail Park, Bedford - St Johns Retail Park and Portsmouth - Ocean Retail Park are examples of centres within this class.

63. Medium Bulky Goods Retail Parks

These bulky goods retail parks have a Retail Footprint score of between 50 and 100, occupying the middle ground in terms of size. Bulky goods accounts for at least 60% of the retail offer, although centres with less are also included provided there is no fashion retailing. Examples are Ashford - Gallagher Retail Park, Hull - Clough Road Retail Park and Wick - Wick Retail Park.

64. Small Bulky Goods Retail Parks

The smallest bulky goods retail parks have a Retail Footprint score less than 50. Bulky goods accounts for at least 60% of the retail offer, although centres with less are also be included provided there is no fashion retailing. To exemplify, three centres in this class are Aberystwyth - Parc Y Llyn Retail Park, Plymouth - Friary Retail Park and Hemel Hempstead - London Road Retail Park.

65. London Retail Parks

All retail parks within Inner or Outer London are grouped together in this class regardless of whether they are fashion or bulky goods-led or neither, as the overriding similarity with these centres is the nature of their catchments, which is limited in size due both to the density of population and the level of competition from other centres. Although a range of centre sizes exist within this class, larger centres such as Purley Way still pull from a reasonably wide area. London - Beckton Triangle Retail Park, London - Gallions Reach Shopping Park and Hayes - Lombardy Retail Park are all examples.

13. SUPERMARKETS

Centre Count: 79

Avg Score: 45

Avg. Expenditure: £21m

This major class represents standalone supermarket locations with an element of comparison goods retailing. There are 79 standalone supermarkets included, with an average attractiveness score of 45 and taking an average annual comparison goods figure of £21 million.

66. Supermarkets

These are supermarket locations where the store sits in isolation and contains a large enough non-food offer to act as a comparison goods offer in its own right. Five fascias can qualify for this class – Asda, Sainsburys, Tesco, Morrisons and Waitrose – and to do so, the individual store size must be greater than 50,000 square feet (net selling space). Non-food sales area and sales per square foot are allocated using industry knowledge of space and trading ratios at supermarkets, enabling CACI to award scores to supermarkets in the same way as attractiveness scores are awarded to other retailers. Catchments can thus be produced and compared in the same way as other centres. Examples of standalone

supermarkets included in the model are Wrexham – Asda and Horley - Tesco-Extra.

14. INTERNATIONAL TRANSPORT TERMINI

Centre Count: 23

Avg Score: 90

Avg. Expenditure: N/A

These are travel based convenience destinations and have no catchments, which is due to their unique behaviour. These centres are assigned a Retail Footprint attractiveness score and seed point but are not an influence within the model.

67. International Transport Termini

There are 22 Airport centres in this class, such as London Heathrow, London Gatwick Airport - North Terminal and Glasgow Airport, along with the Eurotunnel Terminal at Folkestone.

Appendix 2 – Supplementary Databases

Shopping Centres Database

The Shopping Centres database is designed to supplement Retail Footprint. It is not a separate gravity model but allows isolation of specific named shopping centre schemes that lie within larger Retail Footprint centres – not just those that are Retail Footprint centres in their own right. The database provides a wealth of detail in terms of the retailer mix within each shopping centre.

The 2012 version covers 1,089 shopping centres across 721 Retail Footprint centres in Great Britain.

There are 220 Retail Footprint centres with more than one shopping centre associated. For example, there are 11 shopping centres associated with the centre of Leeds, including Victoria Quarter, Merrion Centre, St John's Centre and Leeds Shopping Plaza.

Information provided about each shopping centre includes:

- The Retail Footprint Centre it lies within
- Location (Easting and Northing)
- Total Shopping Centre Score, and also broken down by Fashion, Grocery, Bulky Goods and Footfall Generators
- Independents, Multiples and Total Retailer counts
- Retailer Quality (% value, mass and premium)
- Fashion Market Positioning (% lower, lower middle, middle, upper middle and upper)
- Retail Category Mix (% of score as department store, clothing & footwear etc. at two levels of detail)

This information can be used for a range of purposes such as centre benchmarking and assessing the suitability for potential occupiers based on the existing tenant mix.

Shopping centres are scored in the same way as Retail Footprint centres.

Retail Parks Database

As with the Shopping Centres database, the Retail Parks database is designed to supplement Retail Footprint, allowing isolation of specific retail parks that lie within Retail Footprint centres as well as those retail parks that are centres in their own right.

The 2012 version covers 1,174 retail parks across 988 Retail Footprint centres in Great Britain.

Note that some Retail Footprint centres classified as Retail Parks are split into separate constituent retail parks in the Retail Parks database, and that retail parks can also fall in other centres such as Major Centres. Therefore there are more retail parks in the database than the number of centres classed as Retail Parks in Retail Footprint.

Information provided about each retail park includes:

- The Retail Footprint Centre it lies within
- Location (Easting and Northing)
- Total Retail Park Score, and also broken down by Fashion, Grocery, Bulky Goods and Footfall Generators
- Independents, Multiples and Total Retailer counts
- Retailer Quality (% value, mass and premium)
- Fashion Market Positioning (% lower, lower middle, middle, upper middle and upper)
- Retail Category mix (% of score as department store etc.)

Retail Parks are scored in the same way as Retail Footprint centres.

Introduction

What is ProVision?

ProVision defines the catchments and turnover for all supermarkets over 3,000 square feet. Recognising that consumers living in an area have a choice of stores at which to shop, it predicts what they are likely to spend and where.

ProVision creates realistic, overlapping catchments reflecting the local road network, the location and the strength of competing stores. It takes account of store fascia, size, drive-time and shopper demographics to understand how attractive stores will be to customers in the area. Catchments are defined using low level census geography (Output Area).

Turnovers are predicted for each store, depending upon the amount of money available in the catchment. This figure is based upon the latest spend estimates and accounts for population and the demographic make-up of the catchment. Sales per square foot will vary by store size, so larger stores will have lower sales densities. Turnover predictions reflect total spend at supermarkets including online sales and non-food.

The model is fully updated annually to capture changes in the competitive landscape, food inflation and retailer performance.

How can ProVision be used?

Understand supermarket catchments

- Target marketing campaigns more effectively by understanding the catchment extent and likely market share at a local level
- Discover key battlegrounds and areas of catchment overlap with existing and competing stores
- Understand the demographic make-up of shoppers at store level to ensure the right product range and promotional activity is in place
- Present consumers with the most appropriate store format and category product mix

Predict sales, impacts and future scenarios

- Estimate turnover and sale densities for potential new stores to ensure financial viability
- Assess the impact of change across the retail grocery network; new stores, refits and fascia change to ensure you react effectively
- Quantify market potential for a range of possible supermarket tenants
- Identify the most suitable grocery retailer to capitalise on the opportunity, complement other retailers in the scheme and gain valuable market share
- Supplement rent review analysis with information defining the likely value of a site to a specific grocer

- Understand cannibalisation and impact on existing stores
- Support opportunity assessment for scheme developers looking to add a grocery element to the retail mix

Up to date and comprehensive

ProVision is updated annually to ensure we include the most up to date store portfolios, recent acquisitions, individual stores and regional market size. We incorporate data from a range of industry recognised and trusted sources. This ensures ProVision is the best and the only off the shelf supermarket catchment model available.

ProVision is one of many catchment models CACI produce, including models for retail in the UK and internationally, leisure and finance. In addition, to these off-the-shelf products, CACI produce bespoke catchment models for a wide range of clients including grocery retailers, specifically calibrated and tailored to meet their needs.

How was ProVision Built?

ProVision is a 'gravity model' that defines catchments for large grocery stores (supermarkets, superstores and hypermarkets) in Great Britain and Northern Ireland. These catchments overlap because, as in reality, people living in an area will shop at a range of stores.

ProVision calculates a catchment and turnover for each store based on the principles of:

- People are more likely to visit larger, more attractive stores
- The amount and quality of competition
- The size of the population, or more specifically the demand within an area
- Some fascias are more attractive to certain shoppers than others

Distance or Time Taken

Perhaps the most important factor affecting the level of interaction between people and stores is the physical distance that separates them. People do not like to travel long distances, or more importantly, travel for a long period of time if they can visit a similarly attractive store more conveniently. A fundamental principal of gravity modelling is that the closer a destination is, the more likely people are to visit it.

Provision uses the time taken to drive to a store along the road network to measure distance. It also reflects the tendency for people to use short cuts on minor, local roads rather than travelling long distances on motorways for supermarket shopping.

Stores

Store numbers, locations and sizes are based upon a number of sources, including the Local Data Company and CACI's own research among others. These are combined to ensure we have the latest and most accurate list possible at the time the model is updated.

The model includes all main supermarket brands including discounters and excluding specialist frozen food stores (though Iceland is included owing to its non-frozen grocery range).

Convenience store locations are also included in the model to reflect the market, especially in areas with low supermarket provision. Whilst ProVision does not predict their sales, their presence is a factor in the turnover of larger supermarkets. Leakage to convenience stores is also provided in terms of total market share by geographical area.

Store Attractiveness

Set against the important effect of drive time/distance decay is the 'attractiveness' of a particular store. A larger store or one with a stronger offer will have greater 'pulling power' than a smaller store. As a result, people may be willing to travel a greater distance to shop in a store with a stronger offer.

In ProVision, attractiveness is based upon the store size. It is adjusted to account for the rate of increase in the attractiveness decreases as the store gets bigger (i.e. a store double the size is not necessarily twice as attractive).

ProVision recognises that some brands are stronger than others with differing average sales densities and market share. The model is calibrated to ensure the overall sales and densities for each fascia reflect reality, based upon a variety of market data sources including:

- Kantar Worldpanel market share figures
- Retailer annual reports

The effect of distance on each brand is calibrated separately, to reflect the different trading patterns of different store types and fascias (for example an Aldi will have a wider, thinner catchment than a Co-op supermarket which would have a higher share locally, but less from further afield).

Demand

People who live in a particular area make up the 'demand' that is satisfied in the stores covered by ProVision. The extent of that demand, or potential expenditure, is primarily a function of population size. The greater the population, the higher the amount of money spent in nearby supermarkets.

ProVision is built using Output Areas as the geographical building blocks for demand. These are the small areas at which census data is released, each with an average population of 125.

The money available in each of these units is based upon CACI's grocery expenditure demand estimates, adjusted to match the total market size to reflect non-food items and household goods that are also bought at supermarket tills.

Online spend is included for those retailers that are included in the model (Ocado is excluded).

Expenditure is based upon residential population but not workers or tourism spend. These are available from CACI Ltd as modelled estimates and bespoke models.

Demographics

ProVision reflects the tendency for certain demographic groups to shop with certain retailers. This is modelled using ACORN Categories, the highest level of CACI's demographic classification, which classifies each individual postcode as one of five categories (Wealthy Achievers, Urban Prosperity, Comfortably Off, Modest Means or Hard Pressed).

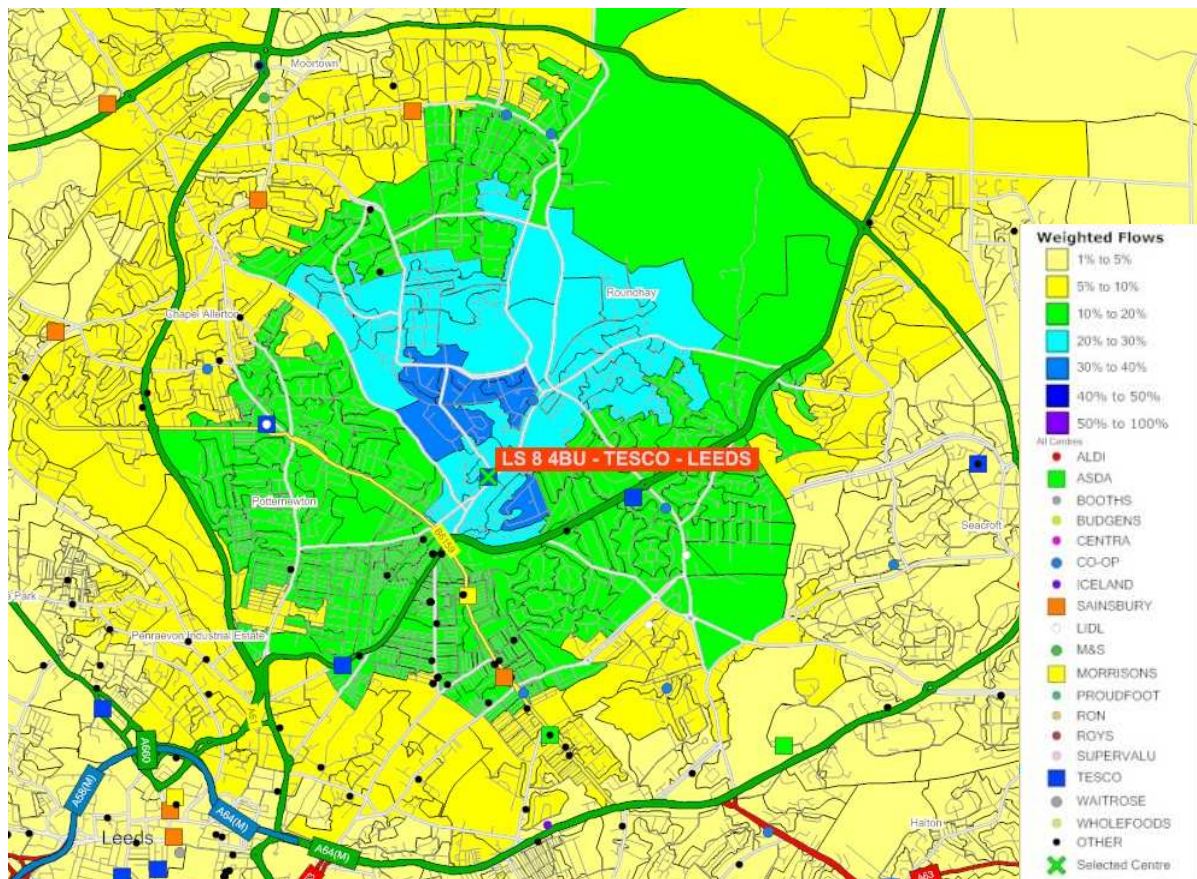

Using Ocean, CACI's individual level database, we understand the propensity of each ACORN category to shop with different retailers and incorporate this into the model.

Model Outputs

Catchment and Turnover

ProVision uses the factors listed above to calculate the likelihood that a person living in a given Output Area will travel to a certain store. This allows ProVision to estimate the amount of supermarket expenditure each Output Area that will be spent at each store.

Aggregating these flows of expenditure allows ProVision to estimate turnovers for each store along with a catchment and expected market share in each Output Area.

Data Source © 2011 TomTom. Contains Ordnance Survey data © Crown copyright and database right 2011

The ProVision model is also available at Postcode Sector level, with modelled Output Area expenditures aggregated to the Postcode Sector in which they fall.

Impacts and “What if” scenarios

ProVision also enables the user to model what the likely impact would be of potential changes in a market, for example the opening of a new or competitor store, extensions, acquisitions and divestments.

The impact of these changes can be measured both in terms of the overall spend in nearby stores and the impact on the extent of the store’s catchment.

Key Changes for ProVision 2012

The 2012 version of ProVision is based on the latest store list, spend data and market share data.

ProVision now covers a total of 6,629 stores, including 6,385 stores across Great Britain and 244 across Northern Ireland, from 19 fascias.

The main changes for the 2012 version are as follows:

Classing

For ProVision 2012 there has been a major change in the way we class stores. This year we have taken into account the surrounding population density for the major players, allowing us to create wider catchments for stores in areas of low population density and tighter catchments in the more dense urban areas. We have also separated out stores with an additional retail draw such as a large Retail Park or Regional Mall to allow them to have a wider draw.

ASDA, Co-Op, J Sainsbury, Morrisons and Tesco stores have been split into four separate classes reflecting population density in the vicinity of the store, rather than the previous store-size based classification:

Class Type	Description
LOW POPULATION DENSITY	< 25,000 population within 5 kilometres
MEDIUM POPULATION DENSITY	> 25,000 population within 5 kilometres
HIGH POPULATION DENSITY	>12,000 population within one kilometre and within a built-up area of population > 200,000
RETAIL PARK	Within a large Retail Park or Regional Mall ('large' defined as having a Retail Footprint Score > 300)

Class distinctions using store size thresholds have been removed with the exception of ASDA, with the 'ASDA SMALL' class accounting for most ex-Netto stores (reflecting their typically lower sales densities), and 'CO-OP LARGE' for Co-op stores greater than 12,000 square feet, as these provide a much wider offer than the typical Co-op store.

Demographic weights

Demographic weights have been calibrated against the latest shopper preference data from CACI's OCEAN database, and extended to cover more fascias. Demographic model parameters were first introduced in 2010 to explicitly account for the varying attractiveness of different fascias to different demographic groups, and are now used for Aldi, ASDA, Co-op, Iceland, J Sainsbury, Lidl, Marks & Spencer, Morrisons, Tesco and Waitrose.
